

Moxi-T Immediate Treatment Plan Following A Diagnosis of Staphylococcus

STAPHYLOCOCCUS 2 WEEK TREATMENT PLAN

RACING CAN BE CONTINUED DURING THIS INTERRUPTED MOXI-T TREATMENT

Week 1 Notes	Mixed into Food	Week 1	In Drinking Water	Mixed into Food	Week 2	In Drinking Water	Week 2 Instructions
<p>There is an opportunity to complete 5 days of treatment by starting Moxi-T on race day.</p> <p>Small, dry brown droppings and a heavy down drop the first morning after Moxi-T treatment suggests Staphylococcus has been recognised before secondary infections have arrived. With more advanced infections the droppings may enlarge and turn green for several days of treatment before they become small, brown and dry. It is important to continue Moxi-T & Megamix for at least 3 days until the droppings become smaller and dry.</p> <p>Moxi-T & Megamix treatments are continued whilst the droppings remain small and loft flying is eager.</p> <p>The last treatment of the first week is given on Wednesday morning. Improved race performance should be expected for the coming race.</p>	Turbobooster E-Powder Ve8 Powder Bloomford	Saturday	Moxi-T Megamix	Turbobooster E-Powder Bloomford F-Vite & Grit	Saturday	Moxi-T Megamix	<p>Week 2 treatments start as early as possible in order to complete a full 10 day treatment if needed.</p> <p>Morning Dropping Checks: Smaller, more dry morning droppings indicates a positive response and need to continue treatment. Larger, moist droppings with any shade of green indicates it is time to stop Moxi-T & Megamix and begin KD to assess the race team's health status.</p> <p>Smaller, more dry morning droppings after KD is a positive response indicating lingering Staphylococcus infection and a need for Race Programme 3 for the next</p>
